

Live Session Agenda

Clever Real Estate · Senior Product Manager (Communication Systems) Joshua Agbabiaka · 60 minutes

Objective. Pressure-test the diagnosis against context the dataset cannot provide, test the proposed measurement and operating model against Clever's actual systems, and challenge the sequencing and resource trade-offs, especially the work I chose to defer.

You have already seen the proposal, so I would rather not present it back. I will pull up the prototype where it helps answer a question.

Time	Discussion	What we should leave with
0-5	Frame the discussion	Shared view on whether the core hypothesis holds: component health is visible, lead-level outcome health may not be
5-20	Resolve the assumptions that change the diagnosis	Outreach semantics and cadence · timestamp semantics · routing and scheduler ownership · unit economics
20-35	Pressure-test the product response	The Lead Lifecycle Ledger, the shared metrics, exception detection and recovery
35-50	Priorities and trade-offs	What to fix immediately, what needs instrumentation first, what we deliberately defer
50-60	Week 1 and open decisions	What we would validate first, who needs to be involved, existing work to build on, remaining risks

The questions I most want to resolve

- What does successful lead handling actually mean at Clever: the real cadence, and what does completed mean on a call?
- Where does lifecycle ownership break today, and which system is the source of truth for what should have happened next?
- What has already been tried in this area, and what stopped it from sticking?
- Given real engineering constraints, which failure is the most expensive to leave unfixed?

Proposal, prototype and supporting artifacts were shared ahead of this session.
